

## Lab 8: Keyboard (Calculator and Caps Lock Control)

### Objective

- ✓ Implement the keyboard function

### Prerequisite

- ✓ Fundamentals of logic gates.
- ✓ Logic modeling in Verilog HDL.
- ✓ Keyboard control procedure

### Experiments

- Implement key board using the left-hand-side keyboard (inside the black blocks).
  - Press 0/1/2/3/4/5/6/7/8/9 and show them in the seven-segment display. When a new number is pressed, the previous number is refreshed and overwritten.
  - Press a/s/m (addition/subtraction/multiplication) and show them in the seven-segment display as your own defined A/S/M pattern. When you press "Enter", refresh (turn off) the seven-segment display.
- Implement a single digit decimal adder using the keyboard as the input and display the results on the 7-segment display (The first two digits are the addend/augend, and the last two digits are the sum).
- Implement a two-digit decimal adder/subtractor/multiplier using the right-hand-side keyboard (inside the red block). You don't need to show all inputs and outputs at the same time in the 7-segment display. You just need to show inputs when they are pressed and show the results after "Enter" is pressed.

4. Implement the “Caps” control in the keyboard. When you press A-Z and a-z in the keyboard, the ASCII code of the pressed key (letter) is shown on 7-bit LEDs.

4.1 Press “Caps Lock” key to change the status of capital/lower case on the keyboard.

Use a led to indicate the status of capital/lowercase in the keyboard and show the ASCII code of the pressed key on 7-bit LEDs.

4.2 Implement the combinational keys. When you press “Shift” and the letter keys at the same time, 7-bit LEDs will show the ASCII code of the uppercase/lowercase of the pressed letter when the “Caps Lock” is at the lowercase/uppercase status.
